Abstract (Basic): WO 200247629 A1

NOVELTY - A polymer composition, comprises a skeleton with N-containing hydrocarbon units and with terminal and/or pendant fatty chains in a make-up composition containing a fatty phase.

DETAILED DESCRIPTION - A composition, comprises an efficient amount of a first polymer (P) of weight average molecular weight less than 100,000 comprising:

(a) a polymeric skeleton having repeating hydrocarbon units containing at least one heteroatom; and optionally

(b) at least one 6-120 C pendant fatty chain and/or optionally functionalized terminal fatty chain, which is bonded to the hydrocarbon units, in a make-up composition (C) comprising in physiologically acceptable medium containing a fatty phase as an agent for increasing the speed of applying make-up to keratin materials and/or for increasing adhesion/firmness of make-up.

An INDEPENDENT CLAIM is also included for a process for improving the adherence/firmness of a cosmetic make-up by using polymer (P in a fatty phase).

USE - The composition is used in cosmetic hair products such as mascara eyeliner and eyelashes

ADVANTAGE - Rapid, efficient and long-lasting application to hairs especially eye lashes
